PROFILE

Computer Science undergraduate who builds end-to-end AI and backend systems — from multi-agent orchestration and retrieval pipelines to event-driven services and mobile clients. Comfortable reasoning about state, concurrency, and failure modes, with a focus on systems that stay reliable and maintainable as they grow.

EXPERIENCE

ITOMATA

AI Engineer Intern

June 2026 — Present

RABLO

Flutter Developer Intern

May 2026 — Present

PROJECTS

HELIOS — Multi-Agent AI OS

Python · FastAPI · Next.js · Ollama · Gemini · LangGraph · FAISS

AI platform coordinating specialized agents for planning, retrieval, code analysis, and validation across multiple LLM providers

→ Orchestrated a DAG-based multi-agent workflow in LangGraph, separating planning, retrieval, code analysis, and validation into independent roles with isolated state and automatic retry on step failure.

→ Engineered a provider-agnostic inference layer abstracting Ollama (local) and Gemini (cloud) behind a common interface, routing requests by task complexity to balance latency, cost, and capability.

→ Implemented a retrieval pipeline with FastAPI and FAISS for document indexing and semantic search, paired with a Next.js frontend that streams agent progress over WebSockets for real-time task monitoring.

MIDAS Pay — AI Fintech Platform

Spring Boot · PostgreSQL · Kafka · Flutter · Isolation Forest ML

Event-driven fintech platform combining real-time transaction processing with ML-based anomaly detection

→ Developed an event-driven transaction pipeline with Spring Boot and Kafka, decoupling ingestion from processing to handle asynchronous workloads without blocking the ledger; backed by PostgreSQL with ACID guarantees for consistent balance state.

→ Evaluated and integrated an Isolation Forest model for transaction-level anomaly detection, iterating on feature engineering to capture spending-pattern signals relevant to fraud flags.

→ Engineered a Flutter client with JWT-based authentication and TLS-secured API calls, exposing a real-time transaction dashboard and AI-assisted categorization to reduce manual tagging.

Whole2 — Commerce Platform

Flutter · Firebase · Riverpod State Management

Cross-platform commerce platform with modular architecture and real-time synchronization

→ Developed the Flutter app's UI layer around Riverpod state management, with a reusable component system shared across product discovery, inventory, and checkout to keep the codebase maintainable as features expanded.

→ Implemented offline-first synchronization with Firebase, queuing local writes and automatically resolving conflicts so the app remains usable and consistent under unreliable network conditions.

→ Modularized the seller dashboard into independent units for authentication, product management, and inventory, isolating concerns to keep the system easier to extend.

EDUCATION

VIT-AP University

B.Tech — Computer Science Engineering

Expected Graduation: May 2027
